

Elicitation Methods

Elicitation methods are crucial tools in User Research, helping us gather valuable information from users. In our project we used a survey to know more about the user. The questions were made by all the team focus on "what students use to test their codes?".

And that was our tool. Based on the survey, we made an exploration test using our prototype to find problems and how to improve the program. As we can see, we need know more about our tool, know if we did the best questions. What we need from the users? And why we need that? We need adapt our project to use elicitation.
