The video *Build a Calculator App in 1 Minute using ChatGPT* explains how to create a simple application using an AI Tool. It describes how with a bunch of prompts we can make a functional calculator using web technologies. I'm impressed about the simpleness of creating a small project in such a little amount of time, without any knowledge of this technologies.

In my experience using AI Tools, I've been able to work with some new technologies or solve a few programming problems that I've encountered. However, I have had to rewrite the prompts and restart my AI Chats in multiple occasions because making appropriate request it also has its learning curve. I find unclear the level of UI quality that we can produce using AI. I guess at this point not all usability problems can be solved just using them, because they may not provide clear or functional solutions. In other words, human creativity (Effective prompts?) remains essential.

This tool will not replace the UX design in the future, but it will improve productivity. This does not mean that the knowledge of the core of user design is not necessary, as we still need to ensure that the information generated is correct.
