

## Usability vs UX

First HCI is the discipline that studies the interaction between people and technologies. Then, **Usability** focuses on the **ease of use** of a product or system. Finally, **User Experience (UX)** goes beyond usability. As we can see, HCI is the base of all, for example, the base of a house, the usability is the structure of the house and UX is like the decoration and ambiance of the house.

These concepts are important in HCI but makes different functions. Usability is all about how **effective and efficient** a system is for completing specific tasks. It asks, "Can users achieve their goals easily and quickly?"

In the other side, UX, or User Experience, encompasses the **overall experience** a user has with a product. It asks, "How do users feel while using the product?"

Usability is an important aspect of UX, ensuring a product is functional and easy to use. However, UX goes beyond usability by considering the user's emotional connection and overall experience with the product. Both elements are essential for creating successful and user-friendly products.
